PC/Windows NT:

Manufacture of assembly map:

- Relationship and orientation of the "contigs" in relation to each other.
- Determination of the clones useful for obtaining the missing sequences between the "contigs"
- Choice of the PCR and sequencing primers for obtaining the missing sequences between the "contigs"
- Determination of the ends of the "contigs" having no relationship with other "contigs" (orphan ends)
- Choice of the PCR primers which make it possible to study the relationship between the orphan ends

Figure 3a

Figure 3b

FIGURE 3A

Distribution and position of the sequences on the contigs:

- 1- Define the arrangement of the contigs in relation to each other
- 2- Define the PCR primers which make it possible to fill the sequence

Statistical determination of the sequences:

- 1- Belonging to the same clone
- 2- Situated on two different contigs

FIGURE 3B

Contigs ends without connecting clone:

- 1- Identification of the ends
- 2- Determination of outer and inner PCR primers for studying the relationships between the contigs

E: outer primers
I: inner primers
